

# Classwork 4 - Local Business Website Redesign Project

---

## Project Overview

You will redesign an existing local business website to improve usability, visual design, accessibility, and responsiveness. The project must be built using **HTML** and **CSS**, created/edited in **Dreamweaver**, and published to **GitHub Pages** (or linked repository). The final submission includes the website files and a deployed site link (or GitHub repo).

---

## Learning Objectives

- Use semantic HTML elements (header, nav, main, section, article, footer) correctly.
  - Build responsive layouts with **flexbox** and **media queries**.
  - Implement CSS hover effects and image handling.
  - Use Dreamweaver to organize a site and export files.
  - Post the project to GitHub and deploy the site.
- 

## Deliverables

1. A redesigned website for a local business (minimum 4 pages: Home, About, Services/Products, Contact).
  2. Source files: `index.html`, additional pages, `css/styles.css`, `images/` folder, and any assets.
  3. Use of **various images** (at least 6 across the site) — logos, hero image, product/service thumbnails, team photos.
  4. A link to the GitHub repository and (preferred) a live GitHub Pages URL.
- 

## Required Features (each must be implemented)

- Use of semantic elements: `<header>`, `<nav>`, `<main>`, `<section>`, `<article>`, `<footer>`.
- Navigation with visible focus and hover states.
- Layouts created with **flexbox** for the header, main content grid/listings, and footer.
- At least one **media query** making the layout adapt at a tablet and mobile breakpoint.
- CSS **hover effects** (buttons, links, image overlays, etc.).

- Use of **various images** (at least 6 across the site).
  - Proper file organization and relative linking.
- 

## Suggested File Structure

```
local-business-redesign/  
├── index.html  
├── about.html  
├── services.html  
├── contact.html  
├── css/  
│   └── styles.css  
├── images/  
│   ├── hero.jpg  
│   ├── logo.png  
│   └── ...
```

---

## Dreamweaver Tips

1. Create a site: *Site* → *New Site* and set the local site folder to the project root.
  2. Use the Files panel to manage files and keep images under `images/`.
  3. Use Live View to preview responsive breakpoints, or use the Device Preview tool.
  4. When inserting images, use `src="images/..."` relative paths (avoid absolute local paths).
  5. Use the Code view to paste the skeleton and CSS, and Design/Live to tweak layout visually.
- 

## Grading Rubric (100 points total)

| Category                                                                    | Points |
|-----------------------------------------------------------------------------|--------|
| Semantic HTML structure (header, nav, main, section, article, footer)       | 20     |
| CSS styling & visual design (typography, spacing, color, hover effects)     | 20     |
| Responsiveness (flexbox use + media queries and mobile layout)              | 20     |
| Accessibility & best practices (alt text, labels, keyboard focus, contrast) | 15     |
| Images & media (quality,                                                    | 15     |

| Category                                                         | Points |
|------------------------------------------------------------------|--------|
| optimization, descriptive alt text)                              |        |
| Navigation & usability (clear links, active state, footer links) | 10     |

**Total:** 100 points

---

## Grading / Submission Checklist

- ☐ GitHub repo link and GitHub Pages live link (if deployed)
- ☐ `index.html` and other pages linked correctly
- ☐ `css/styles.css` file with clear comments
- ☐ `images/` folder with at least 6 images, optimized file sizes
- ☐ Short write-up (250–500 words) explaining design choices and accessibility decisions
